**WARM-UP:**

Graph ABCD with vertices  $A(0, 4)$ ,  $B(2, 2)$ ,  $C(4, 2)$ , and  $D(4, 4)$

Graph the image  $A'B'C'D'$  after a translation using the rule  $(x, y) \rightarrow (x + 2, y - 3)$ .

Are there any geometric characteristics which remained unchanged?

The shape  
Corresponding sides/angles  
Perimeter

**NOTES:**

A **reflection** is a transformation which flips the figure over a line.

This line is called the line of symmetry.

**Example 1:**

$\triangle ABC$  is being reflected over the  $x$ -axis.

Draw and label the image  $\triangle A'B'C'$ .

We can use an arrow to describe this reflection.

$$\triangle ABC \rightarrow \triangle A'B'C'$$

What are the coordinates of:

$$\begin{array}{l} A \underline{1, -3} \rightarrow A' \underline{1, 3} \\ B \underline{3, 0} \rightarrow B' \underline{3, 0} \\ C \underline{4, -2} \rightarrow C' \underline{4, 2} \end{array}$$

How did the coordinates of A change to the coordinates of A'?

y-coordinate - switch the sign

x-coordinate - stayed the same

Tell me more about this figure, is it congruent or similar? Explain how you know.

Congruent - the corresponding angles and sides stayed the same

**Example 2:**

$\triangle ABC$  is reflected over the y-axis.

Draw the image  $\triangle A'B'C'$ .

What are the coordinates of:

A	$(1, -3)$	→	A'	$(-1, -3)$
B	$(3, 0)$	→	B'	$(-3, 0)$
C	$(4, -2)$	→	C'	$(-4, 2)$

How did the coordinates of A change to the coordinates of A'?

x-coordinate - switch to opposite sign  
y-coordinate - stayed the same

**Try it!**
